PortfolioTask.js Reflection

The final activity required creating a standalone script (PortfolioTask.js) incorporating my personal details (Name, Student ID, Lab Group), timestamp, favourite programming language arrow function, and a verification number calculated by summing the last four digits of my Student ID. Integrating string manipulation, mathematical logic, and custom output formatting confirmed my understanding of all preceding exercises. Ensuring that my screenshot contained the full source code, terminal execution output, and computer system clock met the evidence verification standard for submission.

```
@SAANDIP911 ➜/workspaces/cn5006/week3 (main) $ node PortfolioTask.js
Unique Value: 23
